Two Late Iron Age Graves from Vladimirescu*

Sándor Berecki

Abstract: Two inhumation graves were discovered during preventive excavations performed in 2006 in Vladimirescu, Arad County. They are dated to the Late Iron Age and their inventories are specific to the Celtic horizons from the end of the fourth century and the beginning of the third century B.C. in the eastern part of the Carpathian Basin.

Keywords: Late Iron Age, Celts, graves, inhumation, Banat, Carpathian Basin.

In September 2006, during the construction of a house in Vladimirescu, Arad County, in the vicinity of the "Vladilact" farm, 3 km north from River Mureş, two Late Iron Age inhumation graves were disturbed together with settlement traces documented by scattered potsherds from the second-fourth and eleventh–thirteenth centuries A.D. (Pl. 1/1–2)¹.

Oriented S–N, grave no. 1 was observed at 0.90 m in depth and was sectioned by the foundation trench of the building (Pl. 1/3–4). Parts of the skeleton and several objects were recovered by the workers. The pit of the grave could not be observed. An iron spearhead found on the left side of the skull was removed before the arrival of the archaeologists. The archaeological investigation of the proximal area revealed the forearm of the skeleton bent towards the pelvis. A bronze bracelet with a bronze ring was found on the wrist of the left hand, while the bottom of a handmade vessel was placed near the right leg.

The human bones of the robust, tall adult male were severely damaged by the unqualified conditions of discovery. 80% of the skull is missing and only a few fragments from the pelvis, a radius, the left and right humerus bones, the right and left femurs and the left tibia have been preserved. Two animal bone fragments were also identified among the human remains. The recovered grave inventory consists of a spearhead, a bracelet, a ring and piece of pottery. The iron spearhead is poorly preserved, the blade is highly corroded, and the shaft is broken at the tubular neck. Dimensions: length: 175 mm, max. width: 45 mm, thickness: 7 mm, Ø neck: 12 mm, weight: 96 g. The oval bronze bracelet was decorated with two grooves close to the free, enlarged buffer terminals. Dimensions: 73 × 65 mm, thickness: 4 mm. A simple bronze ring was hanged on the bracelet. Dimensions: Ø int. = 21 mm; Ø ext. = 24 mm. The total weight of the two artifacts was 51 g. The bottom of the coarse, handmade pot was brick-red with dark fire clouds on the rough surface. The vessel had gone through oxidizing firing and it was tempered with sand and crushed potsherds. Dimensions: Ø bottom: 115 mm.

A second skeleton was found five meters east from the first grave, at a depth of 0.80 m, oriented SE–NW, also sectioned by the foundation trenches of the building (Pl. 1/5; 2/4). The pit of the grave could not be observed. The hands of the deceased had been placed on the pelvis. The upper jaw of a sow (*Sus scrofa domesticus*) and a small iron knife were found close to the right elbow. A black large bitron-conic vessel with wide mouth and everted rim was placed near the right femur. It was unfortunately destroyed and unrecoverable. An iron object measuring 90 mm was observed above the right knee, but its function could not be determined because of the advanced state of corrosion.

The bones of the robust, adult woman are poorly preserved. From the skull only some fragments have been preserved, together with the left humerus, the radius and the shoulder blade, some rib fragments, and fragments from the right and left femur and tibia. A small, fragmentary, slightly curved iron knife was found close to the animal bones. Dimensions: Length: 51 mm; width: 14 mm, thickness: 2 mm. The black, wheel-made pot was destroyed by soil pressure and could not be recovered. Dimensions: Ø mouth: 130 mm, max. Ø: 280 mm.

1 The research team consisted of: Peter Hügel (scientific coordinator), George P. Hurezan, Florin Mărginean, Zsuzsanna Kopeczny (Arad Museum Complex).

The inventory of grave no. 1 is more than certainly incomplete. Nevertheless, the recovered items allow for a typological analysis and for the chronological determination of the funerary complex.

The buffer-end arm ring from Vladimirescu (Pl. 2/1) can be included in variant B2a-Pișcolt², a simpler and more robust form of this type of jewelry item dated in the cemetery from north-western Romania during the first horizon (LT B1/B2). According to J. Bujna's typology elaborated for the northern part of the Carpathian Basin, this type is part of variant A1-Ba and is to be dated during LT B1³. Two bracelets very similar to the one discovered in Vladimirescu are stray finds from Aradu Nou. One of the items is entirely preserved (with the diameter of 64 mm) and the second is fragmentary, preserving only the buffer end⁴. Another similar item was found in the inhumation grave 2 from the same site besides an early Duchov brooch that dates the funerary complex to LT B2⁵.

Analogies from the eastern part of the Carpathian Basin can also be mentioned from Tărian⁶ and Pișcolt cremation grave 36 (iron bracelet) from the first horizon (LT B1b)⁷. These jewelry items are frequent finds for the early phases in the western and northern parts of the Carpathian Basin and the neighboring areas; such items have been mentioned in Egyházasfalu⁸, Kamond⁹, Kósd¹⁰, Győr¹¹, Kamenín¹², Dubník¹³, Brno-“Chrlice” and “Horní Heršpice”¹⁴, Bedřichovice¹⁵, Blučina-“Konopné zahrádky” and “Hřbitovní ulice”¹⁶, Tikovice¹⁷, Chotusice, Neškaredice, Sedlec¹⁸, Makotřasy (variant with overlapping ends)¹⁹, Kietrz²⁰, Sobešuky, Škrle, Žatec-“Pertsch” și “Klobasa”²¹ and Pottenbrunn²².

In Vladimirescu the bronze arm ring was found on the left wrist of the male deceased. This type of bracelet features more often in women's graves (such as, for example, in Bedřichovice, Blučina-“Konopné zahrádky”, Makotřasy, Sobešuky and Pottenbrunn), but can also be encountered in men's graves (in Dubník and Brno-“Chrlice”, for example). When found in inhumation graves (in Tărian, Kamenín and Kietrz grave 1305 they had been deposited in incineration graves), such items had been most often placed on the left forearm (Dubník grave 2a, Brno-“Chrlice” grave 8, Kietrz grave 1807 and Pottenbrunn grave 1003). The women's grave from Bedřichovice grave 8/80, Makotřasy grave 3 and 5 contained two such bracelets in pairs, one on each forearm. In Brno-“Chrlice” grave 13 a similar bracelet was found on the right humerus, in Blučina-“Konopné zahrádky” grave 19 one bracelet was found on each ankle and in Makotřasy, in grave no. 1 that belonged to a teenager two such bracelets had been placed on the right humerus.

The bronze ring from grave 1 in Vladimirescu (Pl. 2/1), a relatively rare find among the funerary inventories from the Carpathian Basin, can be included in group 100 in Waldhauser's typology elaborated for gold rings²³, with analogies in grave 40 from Dürrnberg²⁴ and with the rings with two spirals but identical section from graves 1 and 5–7 from Stettlen-Deisswil²⁵. It resembles the bronze bracelets type BR-K3-B Bujna from the northern part of the Carpathian Basin, dated there during LT B1 and

B2a²⁶. A bronze ring similar to the one from Vladimirescu has been discovered during the recent excavations in Aradu Nou, in grave 16, where it was also attached to the bracelet that the deceased wore on the right arm. The complex in question is dated, like the entire cemetery, to LT B1/B2 or B2a²⁷. Other close analogies consist of the rings from graves 50, 84, 157 and 158 in Münsingen-Rain, where all items had been deposited on the right arms of the deceased and are dated to phase Ic-Viollier²⁸; the ring from grave 1003 from Pottenbrunn (that also contained a bracelet similar to the one from Vladimirescu), was found on the right arm of a woman²⁹; the ring from grave 117 from Mannersdorf was found on the left arm of a 41–50 years old warrior³⁰ and the ring from grave 60 in Karaburma was dated to the early period of phase III³¹.

Similar rings, but with several curbs, also feature in graves 37 (three rings) and 39 (two rings) from the cemetery in Manching – “Steinbichel”; in both cases they were attached to bracelets placed on the deceased’s left arm³². A ring that is similar in section was discovered beside a series of rings of various types in woman’s grave no. 127 from Maňa³³. A similar ring was also found in the Early Roman grave no. 128 from Zemplín³⁴.

Graves with rings part of the inventory are known in the eastern part of the Carpathian Basin in Fântânele – “Dâmbul Popii” (grave 79/1973)³⁵, Remetea Mare³⁶, Ciumeşti³⁷, Curtuiuşeni graves 2 and 9³⁸, and Pişcolt graves 1, 9, 40, 189 and 202³⁹, all graves belonging to women or children. Though typologically different, the rings from the south-western part of the Carpathian Basin, from Zvonimirovo⁴⁰ and Brežice⁴¹, feature in female graves, but in Mannersdorf and Maňa they feature both in women’s graves and in those of men buried with weapons⁴², just like the one from Vladimirescu. Taking into consideration the conditions of discovery – attached to the bronze bracelet –, one cannot decide on which arm the piece of jewelry was worn. At Pişcolt, in inhumation graves 9, 189 and 202 and in Curtuiuşeni grave 2 they were worn on the left hand and in M181 from Pişcolt on the right hand⁴³.

Besides graves 16 from Aradu Nou and the previously mentioned graves from Manching, a bronze ring attached to a bronze bracelet has also been mentioned in grave 126 Maňa that belonged to an adult man who wore it on the left arm as well, just like in the case of the grave from Vladimirescu, though not on the wrist but on the humerus⁴⁴. A bronze ring attached to a neck chain was found in the cemetery from Maňa⁴⁵, a bronze collar was discovered in Kamenín, incineration grave no. 148⁴⁶, while a ring attached to a brooch was recorded in Brežice grave 56 and Vác – “Gravel pit” grave 53⁴⁷.

One can note that the section of the bronze ring from Vladimirescu is similar to that of the not so wide spread glass rings type 26-Karwowski and of the silver bracelets type 6a-Haevernick and 6a-Karwowski⁴⁸. Though in the case of glass jewelry the shapes with curbs are much more spread and

varied and considering the fact that the bronze rings are earlier than the glass ones, one can presume that the latter were inspired by the first.

The spearhead from grave 1 from Vladimirescu (Pl. 2/3) lacks the largest part of the socketing tube and thus one cannot determine how it was attached to the wooden shaft. Though highly corroded and thus fragmented, the weapon is most probably of type I-Rapin ('classical shapes')⁴⁹, 1.2-Drnić ('spears with a flat-hammered elongated blade and a midrib, rhombic in cross-section') widely dated from LT B2 to LT D in the southern part of the Carpathian Basin⁵⁰, type M1-Pișcolt dated starting with LT B1b⁵¹, type A3-Ludas, dated during LT B2⁵² or type 1-Pieta⁵³.

A small knife, similar to the one deposited in grave 2 from Vladimirescu (Pl. 2/5) was discovered in inhumation grave 2 from Aradu Nou⁵⁴. It belongs to type J-Pișcolt⁵⁵. Analogies for this popular type in the Carpathian area can also be mentioned from Fântânele-'Dâmbul Popii' (graves 62 and 79)⁵⁶, Fântânele-'Dealul Iușului / La Gâța'⁵⁷, Pișcolt graves 9, 146, 152, 188, 190 and 207⁵⁸, Ciumești, grave 28, belonging to a woman, artifact with bone sheath⁵⁹, Tărian, grave 34⁶⁰, Bodroghalom⁶¹, Jászberény-'Cserőhalom'⁶², Sülysáp⁶³, graves nos. 46 and 54 from Mátraszólős-'Királydomb'⁶⁴, graves 6 and 9 from Szőreg⁶⁵, in relatively high numbers in Szentlőrinc⁶⁶ or the cemetery from Bučany graves 8, 10, 23⁶⁷. Other items dated from LT B2 until LT C, discovered both in women's and in men's graves, are known from the cemetery in Ludas-'Varjú-Dűlő', where one of the knives preserves the decorated bone hilt as well⁶⁸. In Karaburma, the similar knife from grave 14 had a decorated blade⁶⁹. Almost always placed in graves besides animal inventories, these items are considered to be of Scythian tradition⁷⁰. They differ from billhooks through size and grave placing, as billhooks are often found together with whetstones⁷¹. Such knives also feature in the inventory of complexes from settlements, such as pit-houses B and C from Ciumești⁷².

The dating of the funerary inventory is mainly provided by the bronze bracelet with buffer-ended terminals. In the north-western part of the Carpathian Basin⁷³ but also in the cemetery from Pișcolt⁷⁴ this type of items has been dated to LT B1/B2. Thus the funerary inventory of grave 1 is dated to the first Celtic horizon from the Carpathian Basin, in the end of the fourth century B.C.⁷⁵. The inventory of grave 2 from Vladimirescu unfortunately does not allow for an exact chronological determination, as small curved knives are specific to all Celtic horizons.

Several Early and Middle La Tène sites are known in southern Crișana and northern Banat, on the Lower Mureș. A settlement with pit-buildings was identified during the 1970s in Vladimirescu during construction works performed in the north-western vicinity of the present discoveries, while traces of a second settlement are mentioned two km south-east, close to the ‘five mounds’⁷⁶. The most important settlement in the area, dated to LT C1, is the one from Cicir–“La Gropi”, where several pit-houses with their corresponding pits were researched between 1965 and 1968⁷⁷. A less researched settlement dated to LT C is mentioned in Șeitin–“Şälancă”⁷⁸. Several La Tène weapons, jewelry items, tools and pots were found in Pecica, probably part of funerary inventories⁷⁹. An anklet with three large hollow knobs is mentioned close by, in Sânpetru German⁸⁰.

Another settlement was excavated during rescue excavations performed on the occasion of the construction of the highway in the vicinity of Arad, south of River Mureș. An incineration grave was found in Arad as well, on the territory of the former “IAS Ceala” farm in 1964. Its inventory contained four pots and five bronze bracelets dated to the first horizon in the eastern part of the Carpathian Basin (LT B1)⁸¹. Three wheel-thrown pots were discovered in 1912 and 1962 in the “Gai” Neighborhood, probably from graves in a bi-ritual cemetery dated to the Middle La Tène (LT B2–C)⁸². Another cemetery dated to LT B2a was repeatedly researched in “Aradu Nou Neighborhood”; a total number of 18 graves were discovered (two in 1967 and 16 in 2010), though several graves had been disturbed before the researches and others are outside the perimeter researched in 2010 during the construction of the highway⁸³.

River Mureș had a special role in the colonization process of Transylvania in the middle of the fourth century B.C., as it was one of the main communication routes towards the intra-Carpathian regions. The fact that some communities settled in the Mureș plain areas of Banat and Crișana and that others left upstream on the Mureșului Valley indicate the complex processes through which communities arrived from the center of Europe settled in the eastern Carpathian region. From a geo-political perspective, the Lower Mureș had an important role not only in the early colonization stage of the La Tène in the eastern part of the Carpathian Basin, but also during the subsequent decades when mobility adopted other forms and the region became an intermediary zone, of mediation and transit of Central European stylistic, technical and spiritual innovations while from east to west it mediated the circulation of authentic eastern elements.

Acknowledgments

Florin Mărginean from the Arad Museum Complex has kindly provided for publication the documentation and inventory of the two graves and I hereby thank him. Szilárd-Sándor Gál has analyzed the human bones and Imola Kelemen has determined the animal bones. I am also grateful to Aurel Rustoiu for the information he has provided me.
